

## Balzer Inc. Introduces New Patented Steerable Track System

*Press Release, June 2013*

MOUNTAIN LAKE, Minnesota (June 1, 2013) - An all new, patented steerable track system is now available from Balzer. The rear steering tracks turn as tight as a tire with 10 degrees of steering radius per track assembly. The front axle remains fixed, acting as a pivot point for the rear steering axle to follow. With four tracks per machine versus just two, it offers ultimate flotation with a larger foot print.

Each track presents a foot print surface equal to 2,592 square inches. The tracks are designed with a double tandem system which allows the idlers and bogies to divide the weight properly. Steerable rear tracks make it the most maneuverable system on the market with the ability to carry massive capacities while minimizing compaction.

The patented steerable track system from Balzer is available on Balzer manure tanks as well as all models of large capacity grain carts. The retail add-on price for tracks is \$29,750.

Balzer Inc. serves niche markets which allows the company to adapt quickly to the high demands placed on today's producer. Balzer strongly believes in being good stewards of agricultural environments. The new steering Field Floater 4 on tracks takes your operation to the next level with maximum productivity and efficiency.
